

# 3D Synchro

Synchro tapping chuck

AUTOMOTIVE

GENERAL  
MECHANICAL  
ENGINEERING

RENEWABLE  
ENERGY

## Features

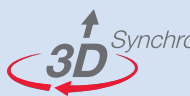

- Minimum length compensation in compression and tension direction
- Ball bearing mounted (i.e. torque independent) suspension
- Suitable for internal coolant supply up to 80 bar
- Suitable for taps and thread formers
- Suitable for right-hand and left-hand threads
- Optimized spring-damper technology ( $\pm 0.5\text{mm}$ )
- 3D Synchro completely encapsulated function chamber (washable up to  $80^{\circ}\text{C}$ )
- Optimized seal (comparable to IP68)

Tool presetting via axial adjustment screw possible from both sides  
(screw is not included in the scope of delivery)

## Advantag

- Reduction of the pressure on the thread flanks Compensation of synchronization errors
- Higher process stability  
Longer tap life
- Better thread quality

The patented spring-damper technology reduces stresses during tapping and forming

  
**Direction of rotation**  
Damping during chip breaking

  
**Direction of pull**  
Compensate the synchronization errors

  
**Print direction**  
Steaming at the gate

# Best application

You can use our 3D-Synchro chuck as a collet chuck for driven tool holders as well as for direct clamping in machine spindles.

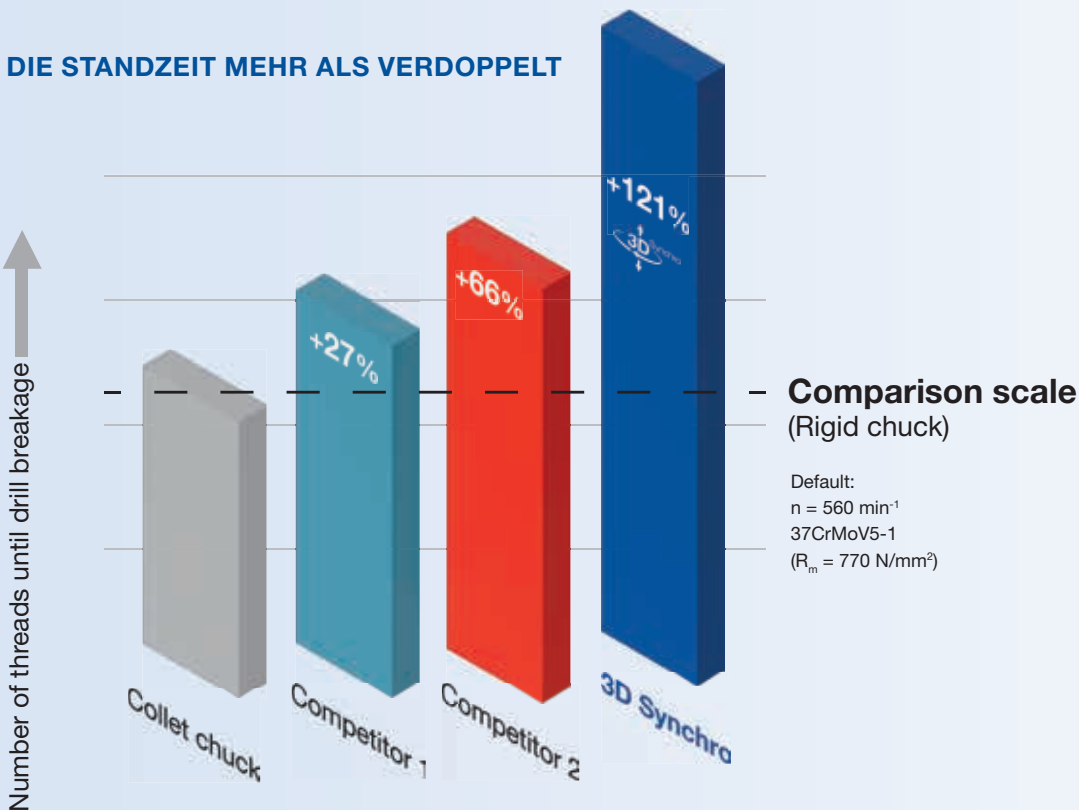

## HIGHER PROCESS STABILITY BETTER THREAD QUALITY LONGER SERVICE LIFE

The latest generation S3D- Synchro chuck has been adapted to the current market requirements. Tool presetting is possible from the machine side and the tool side, the lubricant feed-through has been optimized, thus ensuring a leakage-free transfer to the tap.

The length compensation on compression and tension (e.g. +/- 0.5 mm), as well as the damping in the direction of rotation compensate for the smallest synchronization errors and position deviations. This reduces the pressure on the thread flanks of the tool and minimizes the required

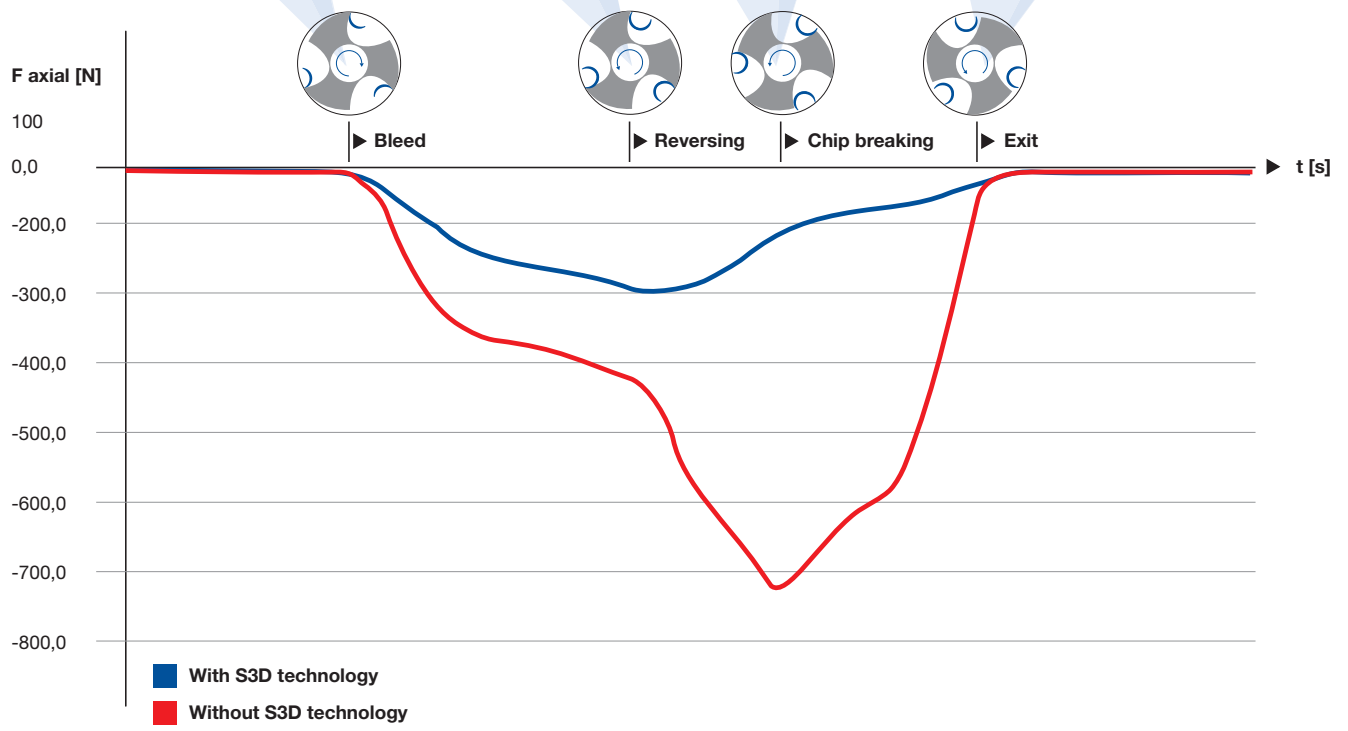

## DIE STANDZEIT MEHR ALS VERDOPPELT

\*1 220% tool life of M8 tap in endurance test at n= 560 min<sup>-1</sup> in X37CrMoV5-1 (R<sub>m</sub>= 770 N/mm<sup>2</sup>) with the S3D Synchro chuck compared to 100% tool life with a standard collet holder.

\*2 200% cutting speed = 25 m/min with M10 tap in grey cast iron GG20 (R<sub>m</sub> > 200 N/mm<sup>2</sup>) with the S3D Synchro chuck compared to 100% = 12.5 25 m/min with a standard collet holder while maintaining thread quality and tolerance. With the standard collet chuck, the cutting speed could not be increased, otherwise the threads would no longer be within tolerance.

## REDUCTION OF THE LOAD

The elastomers used are dimensionally stable and resistant to all coolants/lubricants. Due to the defined length compensation, plastic deformation of the damping elements is excluded.

This results in consistent cutting behavior over the entire life of the tool.

**Important notes**

**Assembling Collet:**

Insert groove of the collet into eccentric ring of the clamping nut at the mark on the bottom of the nut. Push collet in the direction of the arrow until it clicks in.

Insert tool. Screw nut with collet onto tool holder.

**Removing Collet:**

After the nut is unscrewed from the toolholder, press on the face of the collet while simultaneously pushing sideways on the back of the collet opposite the mark until it disengages from the clamping nut.

**Improper assembly** can permanently damage the concentricity of the collet and may result in the destruction of the clamping nut. Only mount nuts with correctly inserted collets. Never place the collet into the holder without first assembling into the nut.

Customer proximity and innovative spirit  
have characterized our actions since 1919.
